

#Jenny

Finally I get this ebook, thanks for all these I can get now!

#Rio

Cool! I'am really happy

#Markus Jensen

I did not think that this would work, my best friend showed me this website, and it does! I get my most wanted eBook

#Hun Tsu

wtf this great ebook for free?!

#Che Salsa

My friends are so mad that they do not know how I have all the high quality ebook which they do not!

#Diego Butler

so many fake sites. this is the first one which worked! Many thanks

18 CHAPTER 1 CHEMISTRY: THE STUDY OF CHANGE

- 1.89 (a) homogeneous
(b) heterogeneous. The air will contain particular matter, clouds, etc. This mixture is not homogeneous.
- 1.90 First, let's calculate the mass (in g) of water in the pool. We perform this conversion because we know there is 1 g of chlorine needed per million grams of water.
- $$(2.0 \times 10^6 \text{ g}) \left(\frac{1 \text{ mg Cl}_2}{1 \text{ mg}} \right) \left(\frac{1 \text{ g}}{1000 \text{ mg}} \right) \left(\frac{1 \text{ kg}}{1000 \text{ g}} \right) = 2.0 \times 10^3 \text{ kg Cl}_2$$
- Next, let's calculate the mass of chlorine that needs to be added to the pool.
- $$(2.0 \times 10^3 \text{ kg Cl}_2) \left(\frac{1 \text{ g chlorine}}{1 \times 10^6 \text{ g H}_2\text{O}} \right) = 2.0 \text{ g chlorine}$$
- The chlorine solution is only 6 percent chlorine by mass. We can now calculate the volume of chlorine solution that must be added to the pool.
- $$2.0 \text{ g chlorine} \left(\frac{100 \text{ g solution}}{6 \text{ g chlorine}} \right) \left(\frac{1 \text{ mL solution}}{1 \text{ g solution}} \right) = 3.3 \times 10^4 \text{ mL of chlorine solution}$$
- 1.91 $(2.0 \times 10^7 \text{ g}) \left(\frac{1 \text{ kg}}{1000 \text{ g}} \right) = 2.0 \times 10^4 \text{ kg}$
- 1.92 We assume that the thickness of the oil layer is equivalent to the length of one oil molecule. We can calculate the thickness of the oil layer from the volume and surface area.
- $$40 \text{ g} \left(\frac{1 \text{ cm}^3}{0.9 \text{ g}} \right) = 4.4 \times 10^4 \text{ cm}^3$$
- $$0.10 \text{ mL} = 0.10 \text{ cm}^3$$
- Volume = surface area \times thickness
- $$\text{thickness} = \frac{\text{volume}}{\text{surface area}} = \frac{4.4 \times 10^4 \text{ cm}^3}{4.0 \times 10^8 \text{ cm}^2} = 1.1 \times 10^{-4} \text{ cm}$$
- Converting to nm:
- $$(1.1 \times 10^{-4} \text{ cm}) \left(\frac{10 \text{ mm}}{1 \text{ cm}} \right) \left(\frac{1 \text{ nm}}{1 \times 10^{-9} \text{ m}} \right) = 1.1 \text{ nm}$$
- 1.93 The mass of water used by 50,000 people in 1 year is:
- $$50,000 \text{ people} \left(\frac{150 \text{ g water}}{1 \text{ person each day}} \right) \left(\frac{3.75 \times 10^6 \text{ g}}{1 \text{ kg}} \right) \left(\frac{1.0 \text{ kg H}_2\text{O}}{1 \text{ kg}} \right) \left(\frac{1000 \text{ g}}{1 \text{ kg}} \right) = 1.8 \times 10^{12} \text{ g H}_2\text{O}$$
- A concentration of 1 ppm of fluoride in water. In other words, 1 g of fluoride is needed per million grams of water. NaF is 45.0% fluoride by mass. The amount of NaF needed per year is kg is:
- $$(1.8 \times 10^{12} \text{ g H}_2\text{O}) \left(\frac{1 \text{ g F}}{10^6 \text{ g H}_2\text{O}} \right) \left(\frac{1000 \text{ mg}}{1 \text{ g}} \right) \left(\frac{1 \text{ kg}}{1000 \text{ mg}} \right) = 2.3 \times 10^4 \text{ kg NaF}$$
