Energy Management System Standard Iso 50001 Manual

3 WHAT IS ISO 50001?

ISO 50001:2011 is an ISO standard that specifies requirements for establishing, implementing, maintaining and improving an energy management system, whose purpose is to enable an organization to follow a systematic approach in achieving continual improvement of energy performance, including energy efficiency, energy use and consumption. It specifies requirements applicable to energy use and consumption, including measurement, documentation and reporting, design and procurement practices for equipment, systems, processes and personnel that contribute to energy performance.

The EMS applies to all variables affecting energy performance that can be monitored and influenced by the organization. ISO 50001 does not prescribe specific performance criteria with respect to energy, i.e. 20% savings. The ISO 50001 standard for energy management systems has been designed to be used independently, but it can be aligned or integrated with other management systems. It is applicable to any organization, building or manufacturing process that wishes to ensure its conformity to its stated energy policy and wishes to demonstrate this to others. Such conformity can be confirmed by means of self-evaluation and self-declaration of conformity or by certification of the energy management system by an external organization.
